Technologies Used

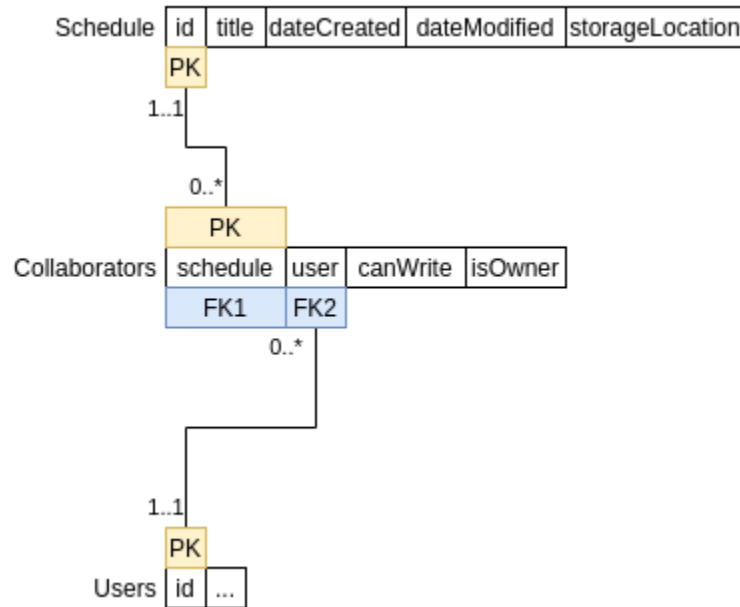

- C#
- .Net
- Ecmascript
- SQL Server 2019 Express Edition
- SQL Server Management Studio
- Video Studio Code and Visual Studio Community

Class Diagram

Database Diagram

Users are associated with Schedules via the Collaborators table, even when there is only one user associated with a Schedule.

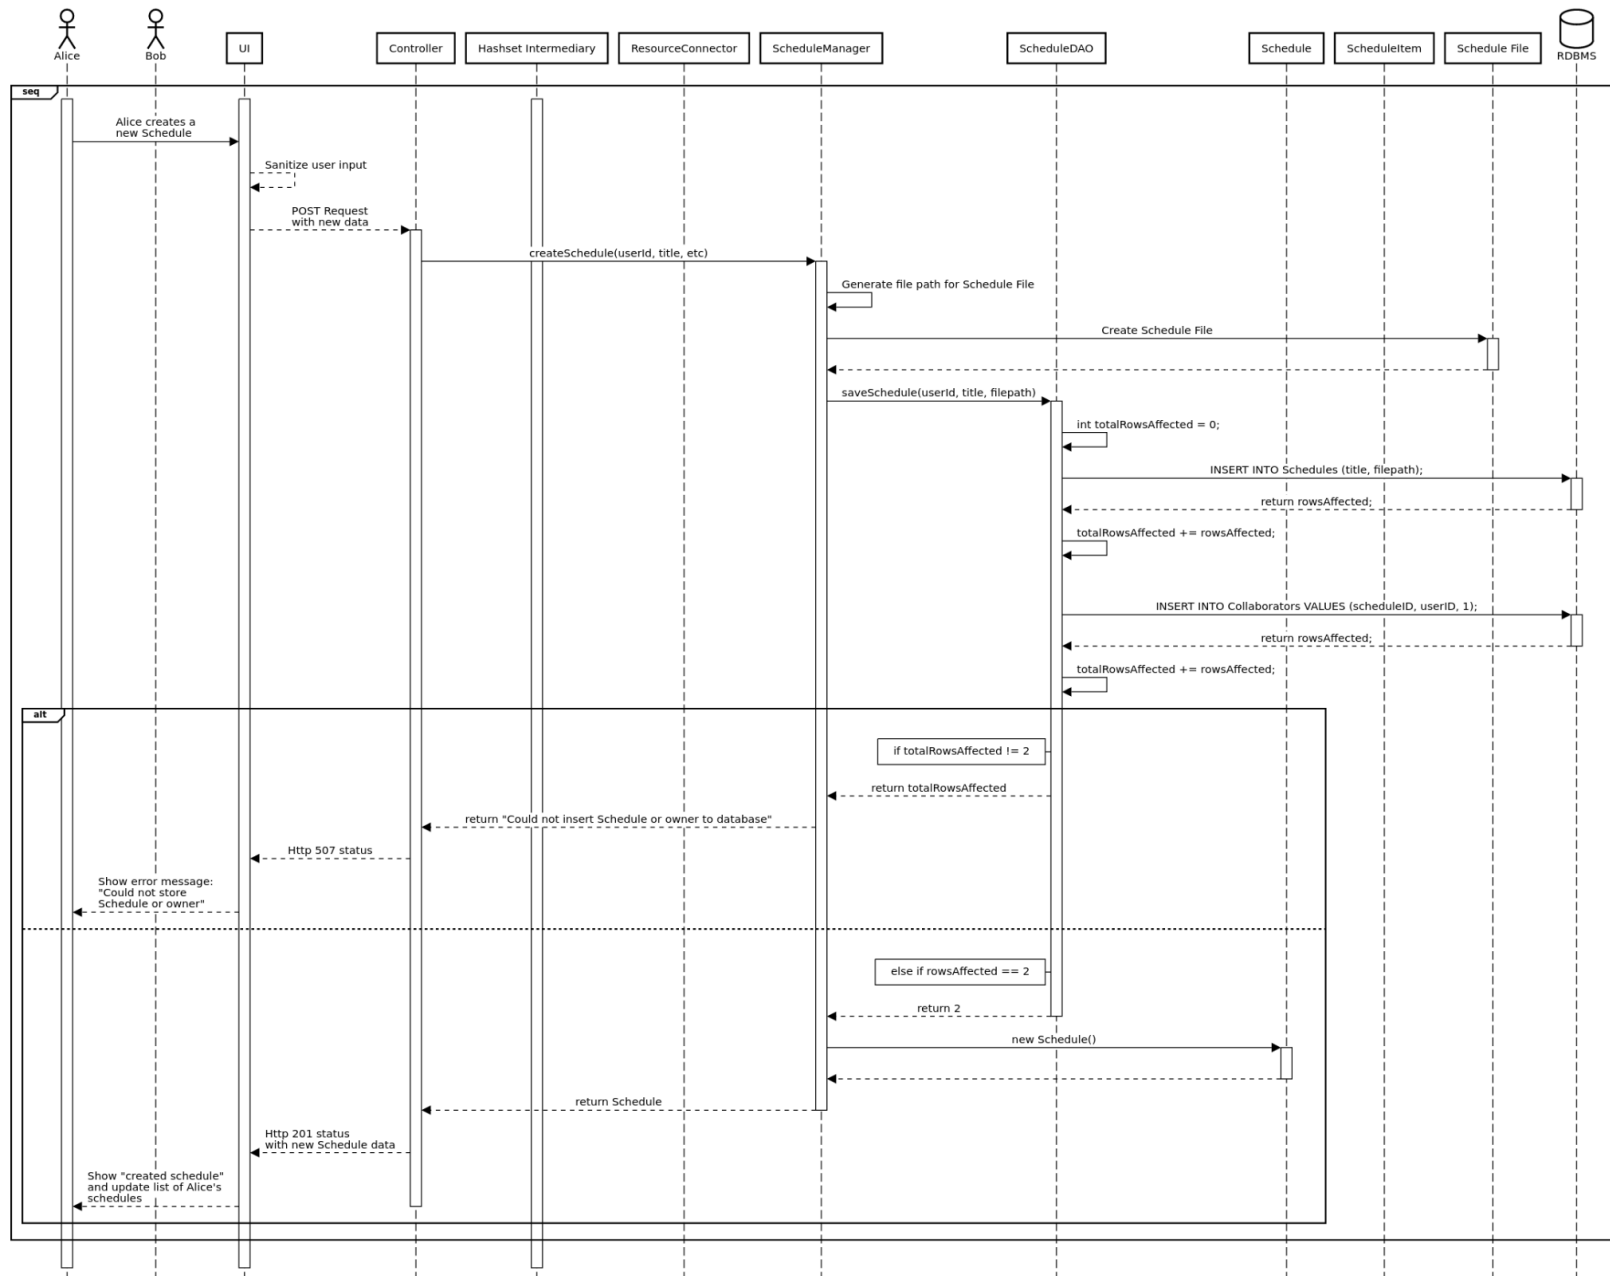

Sequence Diagrams

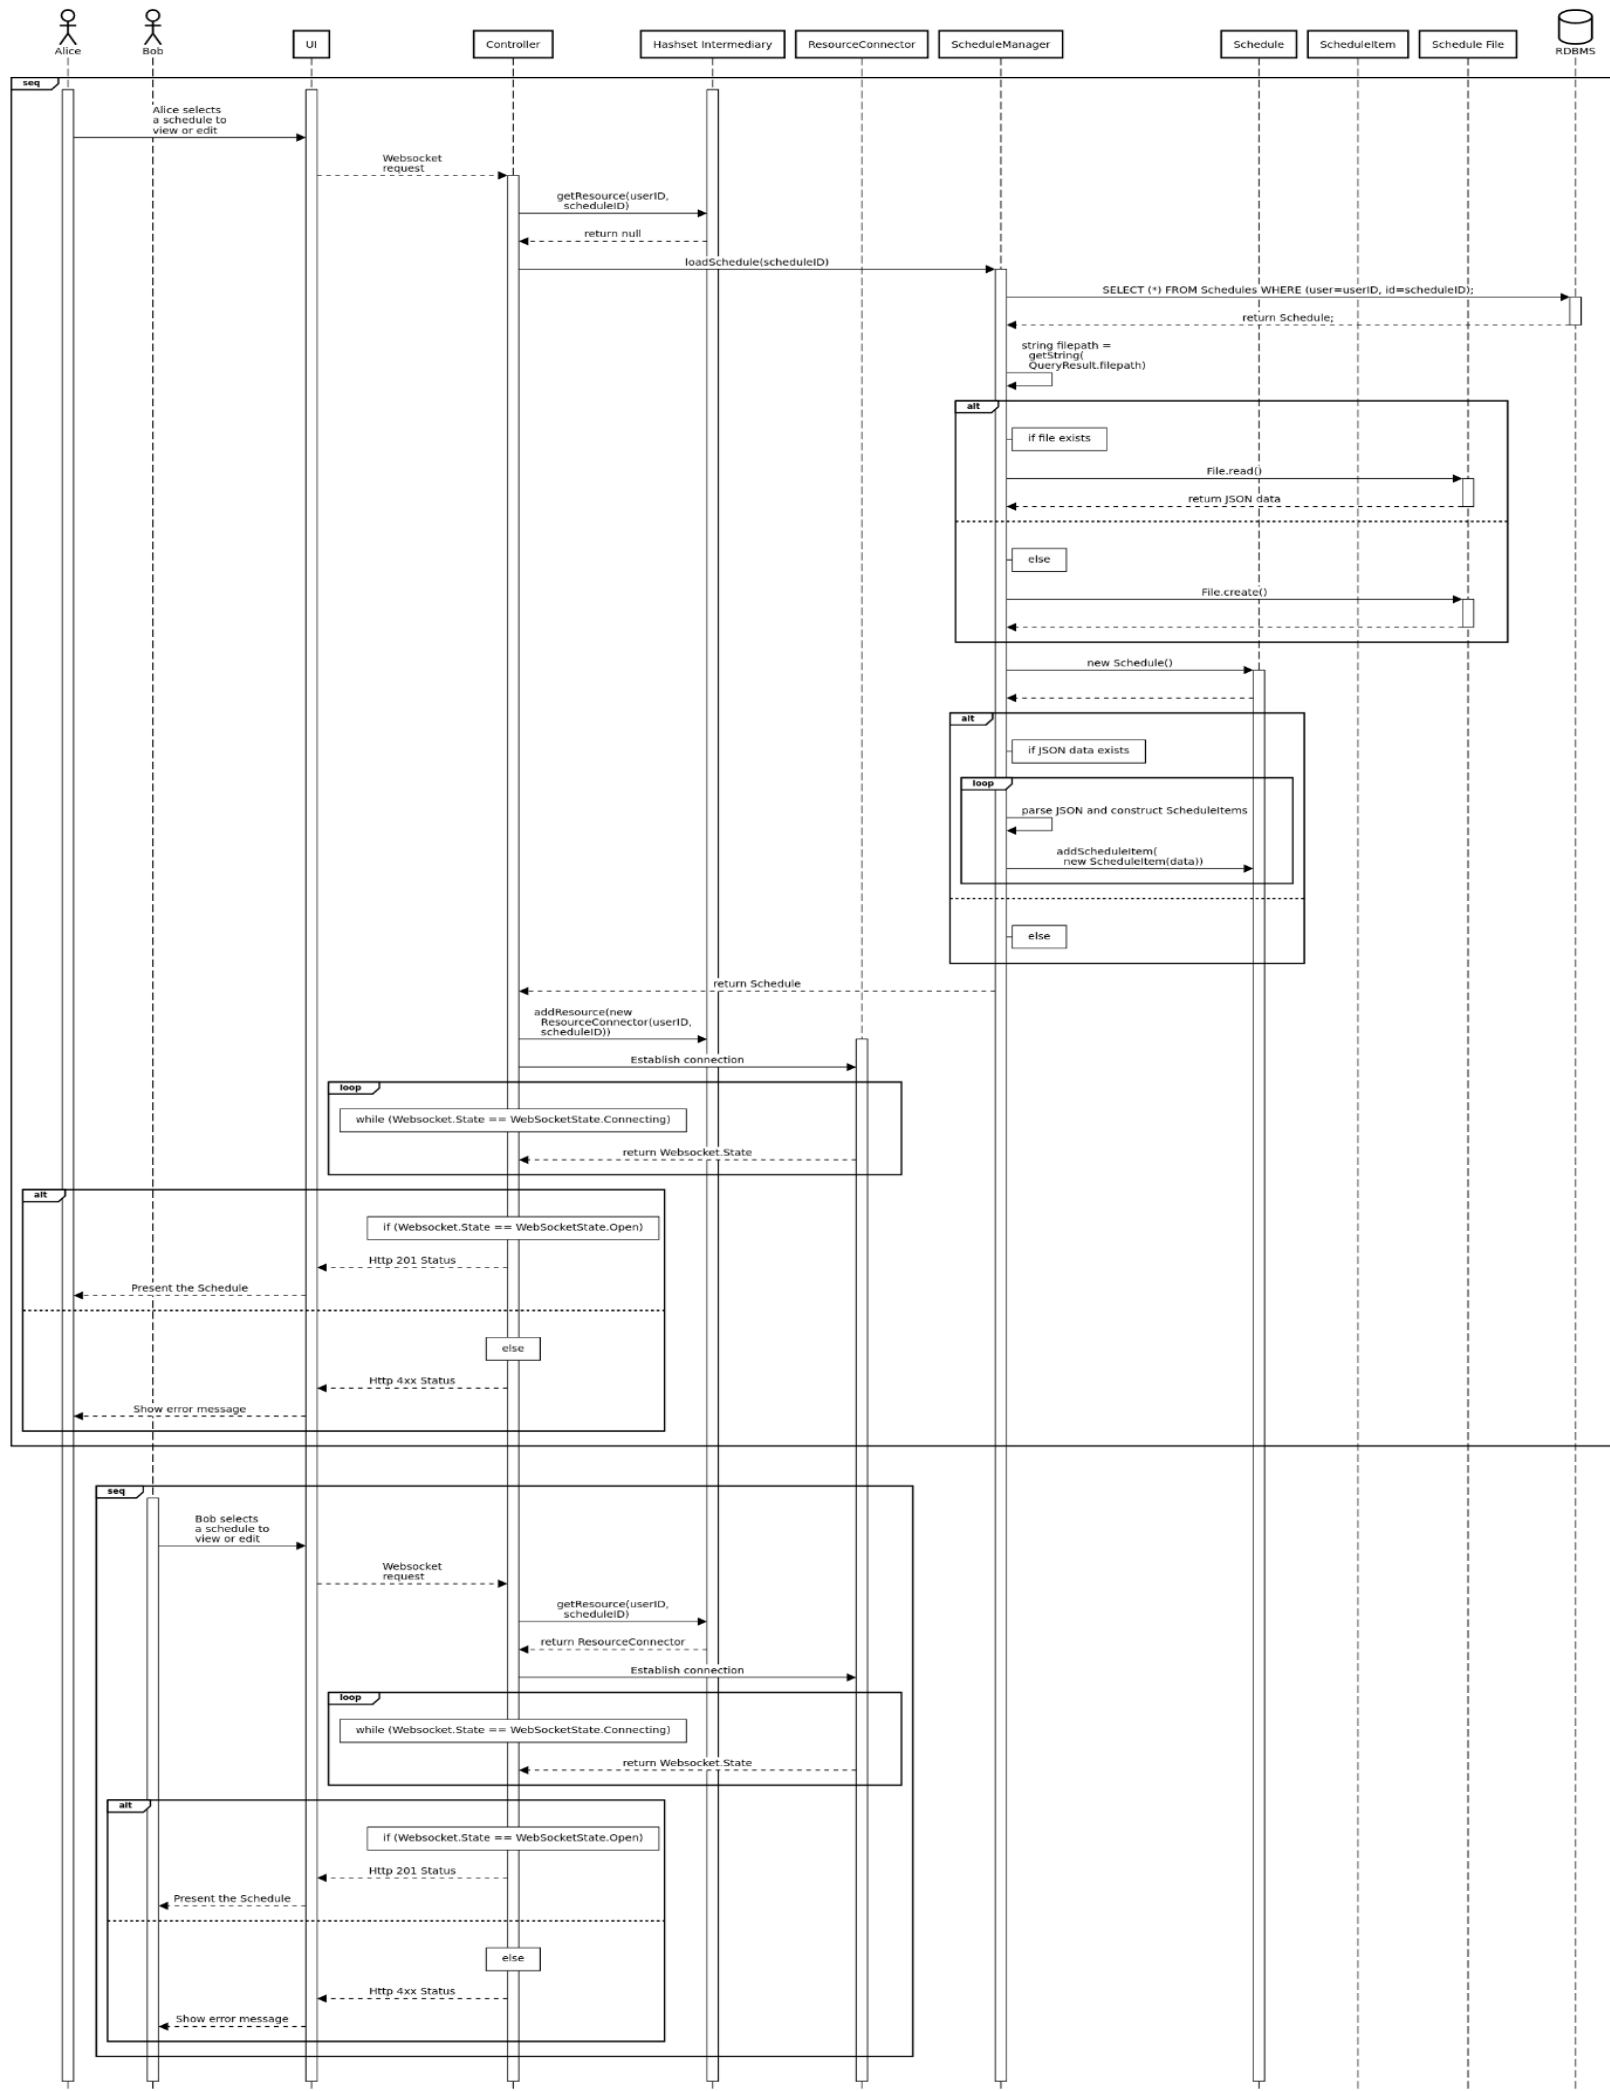

One major problem that the Schedule Builder needs to solve is connecting multiple users to the same shared resource (in this case, Schedules).

- A class intended to solve this problem is an intermediary data structure that the controller can use to connect users to resources. This is intended to be a hash set due to the $O(1)$ best-case access time hashtables offer, but other data structures could be used.
- This is designed with .NET Websockets (System.Net.Websockets) in mind, but could be adapted to use SignalR or other technologies.

User Creates A Schedule

Users Connect To A Schedule

Users Update A Shared Schedule
